SurfaceLevel 2.0

Overview

SurfaceLevel 2.0 is a texture converter and basic image editor. It loads many image file formats, converts to and from almost every video-game API texture (OpenGL, Vulkan, Metal, and Direct3D 12), offers a fast and high-quality resampler, and saves to many file formats. It is useful for performing nearly all video-game–related texture operations, such as compression, pre-multiplying alpha, generating normal maps, resampling/generating crisp mipmaps, etc., and for general-purpose image resampling, colorspace conversion, format conversion, etc. SurfaceLevel 2.0 is meant to gather a large quantity of features together and to provide more options for those features than you will find in any other tool. For example, when resampling, it is possible to specify different samplers for your image width, height, and depth, and different samplers for the RGB colors and the alpha channel—the sharpest resamplers often create ringing, which is particularly bad for the alpha channel; here you can using a ringing filter for the colors but a non-ringing filter for alpha (while specifying the same or different filters for both the color and alpha widths, heights, and depths).

SurfaceLevel 2.0 seeks to be useful in the level of detail for each feature, the number of features, and the performance of each feature. Supports volume (3-D) textures, texture arrays, cube maps, and mipmaps.

Control Flow

SurfaceLevel 2.0 doesn't try to be overly smart, so as long as you understand the basic internal workflow it should be easy to predict what it will do in any edge cases. Internally it performs the following operations in order:

- 1. Loads the image file.
- 2. Performs a conversion to the desired target format.
 - a. Converts to RGBA64F.
 - b. Crops.
 - c. Converts to linear, applying any applicable colorspace conversions and gamma corrections necessary.
 - d. Applies requested transforms, such as swapping, swizzling, flipping, etc.
 - e. Performs resampling and generates mipmaps.
 - f. Applies pre-multiplied alpha.
 - g. Converts to the requested texture format, applying gamma-correction as necessary, etc.
- 3. Saves to the desired file.
 - a. If the current format is not directly supported by the file, it is converted to the nearest format that is supported by the file.

The ways it tries to be smart:

- 1. By default, it will try to ensure only 1 gamma transform occurs from source to linear and from linear to destination. If images do not contain gamma data, they are assumed to be sRGB (-g, -gamma, -srgb, -rgbe, and -linear to change this assumption). If they contain gamma data from an embedded ICC profile, that is used instead. However, if you manually supply a source gamma value with -g, -gamma, -srgb, -rgbe, or -linear, your supplied gamma will be stacked with any contained/embedded gamma data. This can allow you to correct images that may have been saved with incorrect gamma. To specify your own gamma curve to be used *in-place* of any embedded or selected colorspace profiles, use -g, -gamma, -srgb, -rgbe, or -linear to define your own gamma curve and -ignore_input_colorspace_gamma to ignore the gamma curve in any colorspace profiles being used.
- 2. To simplify the process, it is not necessary to specify the export format. If your conversion format is not supported, it will find the closest match that is supported. It will try to ensure a lossless conversion, but the option to specify the export format is always available if needed. This only applies to general image formats. For specialized GPU-leaning formats, such as DDS, KTX, PVR, etc., export will fail if the format specified in -format is not supported by the file.
 For example, -png_format is never strictly necessary because any format supplied by -format can be automatically converted to a format supported by the

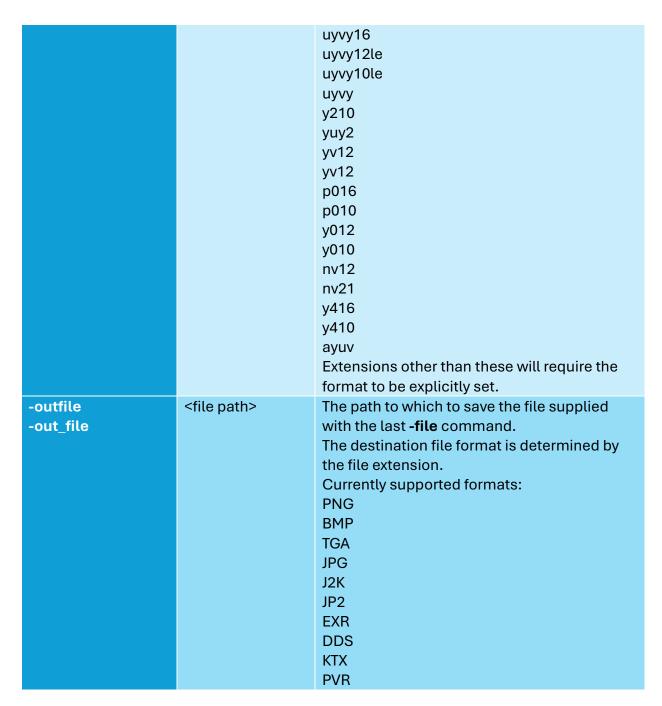

PNG file specification; -png format is entirely optional. However, no automatic

conversion is made when saving to DDS, for example, so the format supplied by – format must be supported by the DDS file specification.

Commands

File

The -file, -yuv_file, and -outfile command can be used multiple times to load and sa multiple files. -yuv_file	Command	Parameter	Description
	-file	<file path=""></file>	A path to an image file to load and convert. The -file , -yuv_file , and -outfile commands can be used multiple times to load and save multiple files.
	-yuv_file		Path to a YUV file to load. If the extension does not indicate the YUV encoding, then - yuv_input_format must be called to specify the YUV encoding. Recognized file extensions: yuv444p16 yuv444p10le yuv444p10le yuv444y12le yuv444y10le yuv444y10le yuv422p16 yuv422p10le yuv422p yuv422p16 yuv422y10le yuv422y yuv420p16 yuv420p yuv420p yuv420p yuv420p yuv420p yuv420p10le yuv420y yuv420y10le yuv420y yuv420y10le yuv420y10le yuv420y

Gamma/Colorspaces

Command	Parameter	Description
-gamma	<gamma></gamma>	Sets the input gamma
-g		power.
		Defaults to -2.2
		(precise sRGB).
		See Notes.

-targetgamma	<gamma></gamma>	Sets the output gamma
-targotgariina	\gaiiiiia>	power.
		Defaults to -2.2
		(precise sRGB).
-rgbe		Sets the source and
-igbe -linear		output gamma to 0.0.
-srgb		Sets the source gamma to -2.2 (precise sRGB).
torget ergh		., .
-target_srgb		Sets the output gamma to -2.2 (precise sRGB).
input colorange	sRGB	Sets the source
-input_colorspace		
	sRGB_precise	colorspace profile to an
	aDCD and	accurate no-gap sRGB. Sets the source
	sRGB_std sRGB_standard	colorspace profile to
	งกเ บ บ_งเลเเนลเน	the standard sRGB.
	smpte_170	Sets the source
	smpte_170 smpte_170m	colorspace profile to an
	170m	accurate no-gap SMPTE
	170111	170M-1999.

bt470_secam	
bt470_l_secam	Coto the source
ntsc_1987	Sets the source
smpte_c	colorspace profile to
	SMPTE C with a
4007	pow(2.2) curve.
ntsc_1987_std	Sets the source
smpte_c_std	colorspace profile to
	the standard SMPTE C.
romm_rgb	Sets the source
rommrgb	colorspace profile to

		D (
		Reference Output Medium Metric RGB
		(ROMM RGB).
	rimm_rgb	Sets the source
	rimmrgb	colorspace profile to
	ппппБр	Reference Input
		Medium Metric RGB
		(RIMM RGB).
	erimm_rgb	Sets the source
	erimmrgb	colorspace profile to
		Extended Reference
		Input Medium Metric
		RGB (ERIMM RGB).
	plasa	Sets the source
	plasa_ansi	colorspace profile to PLASA ANSI E1.54.
	protune	Sets the source
	protune gopro	colorspace profile to
	δοριο	Protune Native (GoPro).
	s-gamut	Sets the source
	sgamut	colorspace profile to S-
	s_gamut	Gamut.
	s-gamut3	Sets the source
	sgamut3	colorspace profile to S-
	s_gamut3	Gamut3.
	s-gamut3cine	Sets the source
	sgamut3cine	colorspace profile to S-
	s_gamut3cine	Gamut3.Cine.
	s-gamut3_cine sgamut3_cine	
	s_gamut3_cine	
-target_colorspace	Same as for	Sets the output
S-3-3-3-3-3-3-3-3-3-3-3-3-3-3-3-3-3-3-3	-input_colorspace.	colorspace profile.
-input_colorspace_file	<file path=""></file>	Sets the input
		colorspace profile.
		Loads .ICC and .ICM
		files.
-target_colorspace_file	<file path=""></file>	Sets the output
		colorspace profile.
		Loads .ICC and .ICM
-dont_embed_icc		files. No colorspace profile
-dont_embed_icc		will be embedded into
		witt be embedded mit

		files with colorspace- profile support.
-embed_icc		Any specified output colorspace profiles will be embedded into files with colorspace-profile support. This is the default.
-ignore_input_colorspace_gamma		The gamma in any supplied or embedded input colorspace profile will be ignored.
-rendering_intent -render_intent	perceptual	All colors are scaled to fit into the target colorspace. Useful for converting from wide colorspaces to more narrow ones.
	relative_colorimetric	Colors in gamut are unchanged, but colors outside of gamut are clipped to the nearest in-gamut color. This is the default.
	saturation	Like perceptual , but tends to make colors more saturated.
	absolute_colorimetric	Not intended for color conversion, but rather typically for digital inkjet proofing.

Resampling

Command	Parameter	Description

-filterd_alpha	Same as for -filter .	Sets the non-mipmap alpha <i>depth</i> filter.
-prescale	<new width=""> <new height=""></new></new>	Resamples the image to the given width/height using the selected non-mipmap filters.
-prescale3 -resample_size	<new width=""> <new height=""> <new depth=""></new></new></new>	Resamples the image to the given width/height/depth using the selected non-mipmap filters.
-resample_to	nearest	Resamples to the nearest power of 2 in each dimension.
	lo	Resamples to the next power-of-2 down.
	hi	Resamples to the next power-of-2 up.
-rel_scale	<width multiplier=""> <height multiplier=""></height></width>	Resamples by the given width and height multipliers.
-rel_scale3	<width multiplier=""> < height multiplier> < depth multiplier></width>	Resamples by the given width, height, and depth multipliers.
-clamp2 -clamp	<width> <height></height></width>	Clamps the image to the given width and height.
-clamp3	<width> <height> <depth></depth></height></width>	Clamps the image to the given width, height, and depth.

Texture Addressing

Command	Parameter	Description
-textureaddressing	clamp	U, V, and W coordinates are clamped to the
-ta		edge of the texture.
		Equal to
		D3D12 TEXTURE ADDRESS MODE CLAMP.

	repeat	U, V, and W coordinates repeat beyond the
	wrap	01 range.
		Equal to
		D3D12_TEXTURE_ADDRESS_MODE_WRAP.
	mirror	U, V, and W are mirrored beyond the 01
	reflect	range.
		Equal to
		D3D12 TEXTURE ADDRESS MODE MIRROR.
	mirroronce	U, V, and W are mirrored 1 time beyond the
	mirror_once	01 range, after which clamping is used.
	minoi_once	
		Equal to D3D12 TEXTURE ADDRESS MODE MIRROR ONC
	bordor	E. The harder color is used when II V and W
	border	The border color is used when U, V, and W
	bordercolor	go outside of 01.
	border_colo	Equal to
	r	D3D12_TEXTURE_ADDRESS_MODE_BORDER.
	no_border	Nothing is considered to exist beyond the
	nul_border	U, V, and W texture edges.
		This is the default.
-textureaddressingw	Same as -	Applies only to the U coordinate.
-taw	ta.	
-textureaddressingh	Same as -	Applies only to the V coordinate.
-tah	ta.	''
-textureaddressingd	Same as -	Applies only to the W coordinate.
-tad	ta.	''
_	Same as -	Applies only to the U coordinate and to
textureaddressingw_opaqu	ta.	color channels.
	ta.	Cotor charmets.
e -taw color		
-taw_cotol	Sama	Applies only to the V coordinate and to
	Same as -	Applies only to the V coordinate and to
textureaddressingh_opaqu	ta.	color channels.
e		
-tah_color	_	
-	Same as -	Applies only to the W coordinate and to
textureaddressingd_opaqu	ta.	color channels.
е		
-tad_color		
-	Same as -	Applies only to the U coordinate and to the
textureaddressingw_alpha	ta.	alpha channel.
-taw_alpha

tan_atpha		atpria orialinoti

-textureaddressingd_alpha	Same as -	Applies only to the W coordinate and to the
-tad_alpha	ta.	alpha channel.
-border_color	<r> <g> </g></r>	Sets the border color for the U, V, and W
	<a>	coordinates.
		Defaults to 0.0 0.0 0.0 1.0 .

Cropping

Command	Parameter	Description
-crop	<x> <y> <width> <height></height></width></y></x>	Crops the input image to the 2-D area specified. Depth/volume images will retain their depths. Cropping outside of the image area is allowed. How areas outside the image area are handled depends on the color texture addressing modes, set via the -textureaddressing commands.
-crop3	<x> <y> <z> <width> <height> <depth></depth></height></width></z></y></x>	Crops a 3-D volume/depth image.
-bake_tex_mapping_u	<address mode=""> <repeats></repeats></address>	Bakes a texture-addressing mode into a texture's U texture coordinates. The addressing mode is one of the - textureaddressing values, and <repeats> indicates how many copies to the left and right to make of the original image. Each copy will be repeated, mirrored, clamped, or border-color'd, which allows baking the texture-addressing into the texture for systems that don't support a given addressing mode or combination of different UVW addressing modes.</repeats>
-bake_tex_mapping_v	<address mode=""> <repeats></repeats></address>	Bakes a texture-addressing mode into a texture's V texture coordinates. The addressing mode is one of the - textureaddressing values, and

		<pre><repeats> indicates how many copies to the top and bottom to make of the original image.</repeats></pre>
-bake_tex_mapping_w	<address mode=""> <repeats></repeats></address>	Bakes a texture-addressing mode into a texture's W texture coordinates. The addressing mode is one of the - textureaddressing values, and <repeats> indicates how many copies to the front and back to make of the original image.</repeats>

YUV Options

Command	Paramet er	Description
- yuv_input_ format	<any dxgi,="" format="" metal="" or="" vulkan,="" yuv=""></any>	Sets the format (encoding) of the YUV file being loaded.
	nv12	DXGI_FORMAT_NV12/ VK_FORMAT_G8_B8R8_2PLANE_420_UNORM
	nv21	DXGI_FORMAT_NV21
	yv12	DXGI_FORMAT_YV12
	yuy2	DXGI_FORMAT_YUY2/VK_FORMAT_G8B8G8R8_422_UNORM/D XGI_FORMAT_G8R8_G8B8_UNORM/MTLPixelFormatGBGR422
	uyvy	DXGI_FORMAT_R8G8_B8G8_UNORM/ VK_FORMAT_B8G8R8G8_422_UNORM/ MTLPixelFormatBGRG422
	p010	DXGI_FORMAT_P010/ VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PA CK16
	p016	DXGI_FORMAT_P016/ VK_FORMAT_G16_B16R16_2PLANE_420_UNORM
	p210	DXGI_FORMAT_P210/ VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PA CK16

	v216	DVCL EODMAT V216/
	y216	DXGI_FORMAT_Y216/ VK_FORMAT_G16B16G16R16_422_UNORM
	y410	DXGI_FORMAT_Y410
	y416	DXGI_FORMAT_Y416
	ayuv	DXGI_FORMAT_AYUV
-	Same as	Sets the encoding when saving to a YUV format.
yuv_forma	-	
t	yuv_inpu	
	t_format	
-		Uses a common approximate YUV -> RGB conversion when
yuv_input_		loading a YUV file.
use_appro		By default the full YUV -> RGB algorithm is used.
X		
-		Uses a common approximate RGB -> YUV conversion when
yuv_use_a		writing to a YUV file.
pprox		By default the full RGB -> YUV algorithm is used.
-	REC_709	Sets the Kr and Kb factors according to the ITU-R
yuv_input_	REC709	Recommendation BT.709-5 standard.
kr_kb		0.212639005871510 and 0.072192315360734.
		This is the default.
	REC_202	Sets the Kr and Kb factors according to the ITU-R
	0	Recommendation BT.2020 standard.
	REC2020	0.2627 and 0.0593.
	SMPTC	Sets the Kr and Kb factors according to the SMPTE C standard.
		0.2124 and 0.0866.
	REC_601	Sets the Kr and Kb factors according to the ITU-R
	REC601	Recommendation BT.601 standard.
		0.2988390 and 0.1143500.
	CIE_1931	Sets the Kr and Kb factors according to the CIE 1931 standard.
	CIE1931	0.3086 and 0.0820.
	NTSC_19	Sets the Kr and Kb factors according to the NTSC 1953
	53	standard.
	NTSC195	0.3 and 0.11.
	3	
	EBU_TEC	Sets the Kr and Kb factors according to the EBU Tech. 3213
	H_3213	standard.
	EBUTEC	0.2988390 and 0.1143500.
	H3213	
-yuv_kr_kb	Same as	Sets the output Kr and Kb factors when saving to a YUV file.
	-	
	yuv_inpu	
	t_kr_kb.	

- yuv_input_ set_kr_kb	<kr> <kb></kb></kr>	Manually specifies the Kr and Kb factors for loading a YUV file.
- yuv_set_kr _kb	<kr> <kb></kb></kr>	Manually specifies the Kr and Kb factors for saving to a YUV file.
- yuv_input_ set_z - yuv_input_ set_black	<black level=""></black>	Sets the black level (01) for loading a YUV file. Defaults to 0.0 .
-yuv_set_z - yuv_set_bl ack	<black level=""></black>	Sets the black level (01) for saving to a YUV file.
- yuv_input_ set_s - yuv_input_ set_scale	<scale></scale>	Sets the scaler (01) for loading a YUV file. Defaults to 1.0 .
-yuv_set_s - yuv_set_sc ale	<scale></scale>	Sets the scaler (01) for saving to a YUV file. Defaults to 1.0 .
yuv_input_		Sets the black level to 0.0, scale to 1.0, Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for loading YUV files.
-yuv_pc		Sets the black level to 0.0, scale to 1.0, Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for saving to a YUV file.
- yuv_input_ studio		Sets the black level to (16.0 / 255.0), scale to (219.0 / 255.0), Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for loading YUV files.
- yuv_studio		Sets the black level to (16.0 / 255.0), scale to (219.0 / 255.0), Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for saving to a YUV file.

Indices & Palettes

Command	Doromotor	Description	
Command	Parameter	Description	

-gen_pal		Generates a new palette for
-gen_palette		indexed images.
-gen_pal_iterations	<iterations></iterations>	Sets the maximum number of iterations when generating a palette. The higher the better. Defaults to the number of colors in the palette. In practice, the number of colors in a palette serves as a hard maximum, but it will exit early if iterations stop causing refinements.
-pal_dither	floyd floyd-steinburg	Selects the type of dithering to use for palettes. Implements Floyd-Steinburg Dithering. This is the default.
	jjn	Implements Jarvis, Judice, and Ninke Dithering.
	stucki	Implements Stucki Dithering, presented 5 years after JJN, offering a similar dither with a slight performance improvement.
	burkes	Implements Burkes Dithering, presented 7years after Stucki, offering yet-another minor hit to quality in exchange for performance.
	sierra	Implements Sierra Dithering.
	sierra2row	Implements Two-Row Sierra Dithering.
	sierralite sierra_lite	Implements Sierra Lite Dithering.
	atkinson atk	Implements Atkinson Dithering, used by the original Macintosh computer.
	bayer4 bayer4x4	Implements a 4×4 Bayer Dither.
	bayer8 bayer8x8	Implements an 8×8 Bayer Dither.
-dither_error_weight -dither_error_weights	<r> <g> <a></g></r>	Sets the per-channel weights for dithering. Defaults to 0.925 0.925 0.925 1.0 .

-dither_error_weight_full -dither_error_weight_100		Sets the dithering weights to 1.0 1.0 1.0.
-dither_error_weight_75		Sets the dithering weights to 0.75 0.75 0.75 1.0.
-dither_error_weight_half -dither_error_weight_50		Sets the dithering weights to 0.5 0.5 1.0.
-dither_error_weight_25		Sets the dithering weights to 0.25 0.25 0.25 1.0.
- dither_error_weight_perceptual -dither_error_weight_perc	REC_709 REC709	Sets the dithering weights to 0.212639005871510 0.715168678767756 0.072192315360734.
	REC_2020 REC2020	Sets the dithering weights to 0.2627 0.678 0.0593.
	SMPTC	Sets the dithering weights to 0.2124 0.7011 0.0866.
	REC_601 REC601 EBU_TECH_3213 EBUTECH3213	Sets the dithering weights to 0.2988390 0.5868110 0.1143500.
	CIE_1931 CIE1931	Sets the dithering weights to 0.3086 0.6094 0.0820.
	NTSC_1953 NTSC1953	Sets the dithering weights to 0.3 0.59 0.11.
-dither_error_weight_scale	<scale></scale>	Scales the dithering weights by the given amount. Can be used to strengthen or soften the effects of perceptual weights. Weights are multiplied each time this command is encountered.

Mipmaps

Command	Parameter	Description
-nomips -nomipmaps -no_mips -no_mipmaps		No mipmaps are generated and existing mipmaps are discarded.
-nmips	<total mipmaps=""></total>	Sets the total number of mipmaps desired. Set to 0 to generate (or keep) a full mipmap chain. Defaults to 0 .

-keepmips		By default, new mipmaps will be generated
-keepmipmaps		as specified by -nmips (which defaults to 0 ,
-keep_mips		so a full chain is generated).
-keep_mipmaps		This command allows existing mipmaps to be retained instead of overwritten. Existing mipmaps beyond the -nmips specification will be truncated, and if -nmips extends beyond the number of existing mipmaps then new mipmaps will be generated to fill
		the gap.
-mip_filter	Same as for -filter .	Applies the selected filter to all mipmap filters.
-mip_filterw	Same as for -filter .	Sets the mipmap color and alpha width filter.
-mip_filterh	Same as for -filter .	Sets the mipmap color and alpha <i>height</i> filter.
-mip_filterd	Same as for -filter .	Sets the mipmap color and alpha <i>depth</i> filter.
-mip_filterw_color	Same as for -filter .	Sets the mipmap color width filter.
-mip_filterh_color	Same as for -filter .	Sets the mipmap color <i>height</i> filter.
-mip_filterd_color	Same as for -filter .	Sets the mipmap color depth filter.
-	Same as for -filter .	Sets the mipmap alpha width filter.
mip_filterw_alpha		
-mip_filterh_alpha	Same as for -filter .	Sets the mipmap alpha height filter.
-mip_filterd_alpha	Same as for -filter .	Sets the mipmap alpha <i>depth</i> filter.

Normal Maps

Command	Parameter	Description
-nm_channel	r red	The normal map will be generated using the R channel.
	g green	The normal map will be generated using the G channel.
	b blue	The normal map will be generated using the B channel.
	a alpha	The normal map will be generated using the A channel.
	max	The normal map will be generated using the max value between the RGBA channels. This is the default.
	rgb	The normal map will be generated using the average value between the RGB channels.
	colorspace	The normal map will be generated using the weighted average value between the RGB channels.

	Use -luma to select from predefined weights or -weight to manually specify weights.
-norm	Indicates that the normal maps should be
-normalize	normalized.
-opengl	Specifies that the normal map should be
-unity	compatible with OpenGL.
-blender	
-maya	
-directx	Specifies that the normal map should be
-ue4	compatible with DirectX.
-unreal	
-unrealengine	
-ue	
-dsmax	
-n3x3	Normal maps will be generated with a 3×3
	kernel.
-n5x5	Normal maps will be generated with a 5×5
	kernel.
-n7x7	Normal maps will be generated with a 7×7
	kernel.
-n9x9	Normal maps will be generated with a 9×9
	kernel.
-scale	Specifies the normal map's Z influence.
-nm_z	

Transforms

Command	Parameter	Description
-format	<any dxgi,="" metal<="" or="" th="" vulkan,=""><th>Converts the loaded image</th></any>	Converts the loaded image
	format>	to the given texture format.
-ogl_format	<internal format=""> <type></type></internal>	Converts the loaded image
	<base format="" internal=""/>	to the given OpenGL texture
		format.
-ignore_alpha		Any alpha channel is set to
		all 1's.
-alpha_threshold	<cutoff></cutoff>	Sets the alpha cutoff
		([0255]) for conversions to
		formats with binary alpha.
		Defaults to 128.
-premultiply_alpha		Specifies that alpha should
-premult_alpha		be pre-multiplied.
		If an image is already pre-
		multiplied it is not pre-
		multiplied again.

-swizzle	<swizzle></swizzle>	Specifies a swizzle to apply.
		Valid swizzle characters:
		rgbaxyzw01. Must be 4
		characters long and is not
		case-sensitive.
-swap		Swaps the R and B
		channels.

Quality Settings

Command	Parameter	Description
-quality_highest		The highest quality setting for compressing textures
-very_slow		in BC*, EAC, ETC*, PVR, and ASTC formats.
-quality_production		The 2 nd -highest quality setting for compressing
-slow		textures in BC*, EAC, ETC*, PVR, and ASTC formats.
-quality_normal		The normal quality setting for compressing textures
-basic		in BC*, EAC, ETC*, PVR, and ASTC formats.
-fast		A fast but somewhat low-quality setting for
		compressing textures in BC*, EAC, ETC*, PVR, and
		ASTC formats.
-quick		A faster but lower-quality setting for compressing
-veryfast		textures in BC*, EAC, ETC*, PVR, and ASTC formats.
-ultrafast		The fastest but lowest-quality setting for
		compressing textures in BC*, EAC, ETC*, PVR, and
		ASTC formats.

Misc.

Command	Parameter	Description
-weight	<red weight=""> <green< th=""><th>Sets the luminance weight factors</th></green<></red>	Sets the luminance weight factors
-weights	weight> <blue weight=""></blue>	manually.
-luma	REC_709	Sets the luminance weight factors
	REC709	according to the ITU-R Recommendation
		BT.709-5 standard.
		0.212639005871510,
		0.715168678767756, and
		0.072192315360734.
		This is the default.
	REC_2020	Sets the luminance weight factors
	REC2020	according to the ITU-R Recommendation
		BT.2020 standard.
		0.2627, 0.678, and 0.0593.

	SMPTC REC_601	Sets the luminance weight factors according to the SMPTE C standard. 0.2124, 0.7011, and 0.0866. Sets the luminance weight factors
	REC601	according to the ITU-R Recommendation BT.601 standard. 0.2988390, 0.5868110, and 0.1143500.
	CIE_1931 CIE1931	Sets the luminance weight factors according to the CIE 1931 standard. 0.3086, 0.6094, and 0.0820.
	NTSC_1953 NTSC1953	Sets the luminance weight factors according to the NTSC 1953 standard. 0.3, 0.59, and 0.11.
	EBU_TECH_3213 EBUTECH3213	Sets the luminance weight factors according to the EBU Tech. 3213 standard. 0.2988390, 0.5868110, and 0.1143500.
-printformats -print_formats		Prints all supported formats that can be supplied to -format .

PNG Options

Command	Parameter	Description
-png_default		Default PNG compression (6) will be used.
-png_bestspeed		Fast PNG compression (1) will be used.
-png_bestcompression		Best PNG compression (9) will be used.
-png_level		Specifies the PNG compression level. [09].
-png_nocompression		No PNG compression will be used.
-png_interlaced		Interlacing will be used. The default is no interlacing.
-png_format	R8G8B8 RGB24 RGB	Specifies the PNG format to which to save. If the format is not specified, the closest format to what was specified by -format (or the original file's format if -

	format is not specified) will be used.

BMP Options

Command	Parameter	Description
-bmp_rle		RLE encoding will be used
		to save the BMP file.
		This is not set by default.
-bmp_noalpha		Alpha will not be saved or
		will be set to 1 in the BMP
		file.
		The default is to store alpha
		when available.

-bmp_nobitmask -bmp_nomask		By default, the BMP file will contain masks for the R, G, B, and A channels. This setting causes the BMP file to be saved without the masks. See Notes.
-bmp_format	R8G8B8 RGB24 RGB	Specifies the BMP format to which to save. See Notes. If the format is not specified, the closest format to what was specified by -format (or the original file's format if -format is not specified) will be used.

	L8 LUMINANCE8 GREYSCALE8 GRAYSCALE8	

EXR Options

Command	Parameter	Description
-exr_float		Saves data as float instead of as half (not
		recommended).
-exr_zip		Saves with zlib compression in blocks of 16 scan
		lines.
-exr_piz		Saves with piz-based wavelet compression.
-exr_pxr24		Saves with lossy 24-bit float compression.
-exr_b44		Saves with lossy 44% float compression—goes to
		22% when combined with -exr_lc .
-exr_lc		Saves images with one luminance and two
		chroma channels, rather than as RGB (lossy
		compression).

J2K Options

Command	Parameter	Description
-j2k_comp -j2k_compression	<x></x>	Quality level (1512). Save rate is X:1. Default is 16:1.
-j2k_format	R8G8B8 RGB24 RGB	Specifies the J2K format to which to save. If the format is not specified, the closest format to what was specified by -format (or the original file's format if -format is not specified) will be used.
	R8G8B8_SRGB RGB24_SRGB RGB_SRGB	
	R8G8B8A8 RGBA32 RGBA	
	R8G8B8A8_SRGB RGBA32_SRGB RGBA_SRGB

L16 LUMINANCE16 GREYSCALE16 GRAYSCALE16	
R16G16B16 RGB16 R16G16B16A16 RGBA16	

JPG Options

Command	Parameter	Description
-jpg_quality	<x></x>	Quality level (0100). Save rate is X:1. Default is 75 .
-jpg_qualitysuperb		Sets the quality level to 100.
-jpg_qualitygood		Sets the quality level to 75.
-jpg_qualitynormal		Sets the quality level to 50.
-jpg_qualityaverage		Sets the quality level 25.
-jpg_qualitybad		Sets the quality level 10.
-jpg_progressive		Saves as a progressive JPEG file. Can be combined with the -jpg_quality* values.
-jpg_subsampling_411		Saves with high 4x1 chroma subsampling (4:1:1).
-jpg_subsampling_420		Saves with medium 2x2 chroma subsampling (4:2:0)—this is the defaul.
-jpg_subsampling_422		Saves with low 2x1 chroma subsampling (4:2:2).
-jpg_subsampling_444		Save with no chroma subsampling (4:4:4).
-jpg_optimize		Causes optional Huffman tables to be computed for the image. Can mildly reduce the file size.
-jpg_baseline		Saves as a basic JPEG file, without metadata or any markers.

Notes

Gamma

• Positive values use a raw pow(1/ γ)-based gamma curve. Negative values are divided into 2 halves: If γ is <= -1.0, an XtoLinear transform is applied; if -1.0 < γ < 0.0,

- a LinearToX transform is applied, where X is the curve specified by one of the standards (sRGB, ITU-R Recommendation BT.709-5, etc.) Generally, gamma will be above 1.0 or below -1.0.
- The default standard curve is sRGB Precise, so a default value of -2.2 results in a precise sRGB -> Linear transform.
- The relationship is reversed for target gamma. A positive value results in a pow(γ) transform being applied, while if γ is <= -1.0, a LinearToX transform is applied; if -1.0 < γ < 0.0, an XtoLinear transform is applied.
- This means that when considering gamma, you specify what the input is and what
 the target should be. By knowing what the input gamma is, the reverse transform
 can be applied to put the image back into linear space, and by knowing what the
 target gamma should be, a proper transform from linear to the target gamma can be
 made.

Texture Addressing

- Texture addressing is used during resampling and normal-map creation.
- For standard image resampling, nul_border is appropriate, as it will only sample
 from in-image texels, meaning no influence from outside 0..1 at all, and edge texels
 won't have an abnormally large influence as they would with clamp. For in-game
 textures, select the addressing mode that matches how it will be addressed in the
 game.

Cropping

- The addressing modes set with the -textureaddressing family of commands are shared with the cropping commands. -crop and -crop3 use whatever addressing modes were set by the -textureaddressing family of commands, and the -bake_tex_* commands will overwrite any previous addressing modes set via the -textureaddressing commands and vice-versa.
- Each -bake_tex_* command overrides that axis of -crop or -crop3, even if -crop or -crop3 comes after the -bake tex * command.

YUV

By default, YUV <-> RGB algorithms that take additional parameters (Kr, Kb, Z, and B) are used. These provide reliable conversions, but many implementations use an approximation for these conversions, which can result in slight adjustments to the colors. Switching to the approximate conversion would be appropriate if you are dealing with a YUV file that has been adjusted to account for this color shift.

- The approximate YUV algorithm does not use Kr, Kb, Z, or B.
- YUV files that contain multiple frames are loaded as 3-D volume textures, with each slice of the depth component being a frame. You can resample the depth component to change the number of frames in the animation. This effectively smoothly speeds up or slows down the animation. Because this is a resampling through time rather than over color frequencies, a linear filter is most appropriate unless a specific visual effect is desired.

BMP

- Bit masks aren't used when saving a file as RLE.
- Some packed formats, such as A4R4G4B4, will only retain their component orders if bit masks are used. Without bit masks, the saved BMP file may have swizzled the components (for example to R4G4B4A4).

Formats

Below is a comprehensive list of formats to which and from which any loaded image can be converted. All formats can be supplied to the <code>-format</code> command, including the first word in the OpenGL format triplets (the internal format), however this will cause the first format encountered that matches the given OpenGL format to be selected, which may not be desired. For this reason, <code>-ogl_format</code> may be desired, which allows specifying the full OpenGL format.
