### SurfaceLevel 2.0

#### Overview

SurfaceLevel 2.0 is a texture converter and basic image editor. It loads many image file formats, converts to and from almost every video-game API texture (OpenGL, Vulkan, Metal, and Direct3D 12), offers a fast and high-quality resampler, and saves to many file formats. It is useful for performing nearly all video-game–related texture operations, such as compression, pre-multiplying alpha, generating normal maps, resampling/generating crisp mipmaps, etc., and for general-purpose image resampling, colorspace conversion, format conversion, etc. SurfaceLevel 2.0 is meant to gather a large quantity of features together and to provide more options for those features than you will find in any other tool. For example, when resampling, it is possible to specify different samplers for your image width, height, and depth, and different samplers for the RGB colors and the alpha channel—the sharpest resamplers often create ringing, which is particularly bad for the alpha channel; here you can using a ringing filter for the colors but a non-ringing filter for alpha (while specifying the same or different filters for both the color and alpha widths, heights, and depths).

SurfaceLevel 2.0 seeks to be useful in the level of detail for each feature, the number of features, and the performance of each feature. Supports volume (3-D) textures, texture arrays, cube maps, and mipmaps.

#### Control Flow

SurfaceLevel 2.0 doesn't try to be overly smart, so as long as you understand the basic internal workflow it should be easy to predict what it will do in any edge cases. Internally it performs the following operations in order:

- 1. Loads the image file.
- 2. Performs a conversion to the desired target format.
  - a. Converts to RGBA64F.
  - b. Converts to linear, applying any applicable colorspace conversions and gamma corrections necessary.
  - c. Applies requested transforms, such as swapping, swizzling, flipping, etc.
  - d. Performs resampling and generates mipmaps.
  - e. Applies pre-multiplied alpha.
  - f. Converts to the requested texture format, applying gamma-correction as necessary, etc.
- 3. Saves to the desired file.

a. If the current format is not directly supported by the file, it is converted to the nearest format that is supported by the file.

#### The ways it tries to be smart:

- 1. By default, it will try to ensure only 1 gamma transform occurs from source to linear and from linear to destination. If images do not contain gamma data, they are assumed to be sRGB (-g, -gamma, -srgb, -rgbe, and -linear to change this assumption). If they contain gamma data, whether implicit by the format (VK\_FORMAT\_B8G8R8\_SRGB, for example) or from an embedded ICC profile, that is used instead. However, if you manually supply a source gamma value with -g, -gamma, -srgb, -rgbe, or -linear, your supplied gamma will be stacked with any contained/embedded gamma data. This can allow you to correct images that may have been saved with incorrect gamma. To specify your own gamma curve to be used *in-place* of any embedded or selected colorspace profiles, use -g, -gamma, -srgb, -rgbe, or -linear to define your own gamma curve and -ignore\_input\_colorspace\_gamma to ignore the gamma curve in any colorspace profiles being used.
- 2. To simplify the process, it is not necessary to specify the export format. If your conversion format is not supported, it will find the closest match that is supported. It will try to ensure a lossless conversion, but the option to specify the export format is always available if needed. This only applies to general image formats. For specialized GPU-leaning formats, such as DDS, KTX, PVR, etc., export will fail if the format specified in -format is not supported by the file.
  For example, -png\_format is never strictly necessary because any format supplied by -format can be automatically converted to a format supported by the PNG file specification; -png\_format is entirely optional. No automatic conversion is made when saving to DDS, for example, so the format supplied by -format must be supported by the DDS file specification.

### Commands

#### File

Command	Parameter	Description
-file	<file path=""></file>	A path to an image file to load and convert.
		The <b>-file</b> , <b>-yuv_file</b> , and <b>-outfile</b> commands
		can be used multiple times to load and save
		multiple files.

-yuv_file	<file path=""></file>	Path to a YUV file to load. If the extension
	<width> <height></height></width>	does not indicate the YUV encoding, then -
	_	yuv_input_format must be called to specify
		the YUV encoding.
		Recognized file extensions:
		yuv444p16
		yuv444p12le
		yuv444p10le
		yuv444p
		yuv444y16
		yuv444y12le
		yuv444y10le
		yuv444y
		yuv422p16
		yuv422p12le
		yuv422p10le
		yuv422p
		yuv422y16
		yuv422y12le
		yuv422y10le
		yuv422y
		yuv420p16
		yuv420p12le
		yuv420p10le
		yuv420p
		yuv420y16
		yuv420y12le
		yuv420y10le
		yuv420y
		yuva12le
		yuva10le

		y210
		yuy2
		yv12
		yv12
		p016
		p010
		y012
		y010
		nv12

		nv21 y416 y410 ayuv Extensions other than these will require the format to be explicitly set.
-outfile -out_file	<file path=""></file>	The path to which to save the file supplied with the last -file command.  The destination file format is determined by the file extension.  Currently supported formats:  PNG  BMP  TGA  JPG  J2K  JP2  EXR  DDS  KTX  PVR

# Gamma/Colorspaces

Command	Parameter	Description
-gamma -g	<gamma></gamma>	Sets the input gamma power. Defaults to <b>-2.2</b> (precise sRGB). See Notes.
-targetgamma	<gamma></gamma>	Sets the output gamma power. Defaults to <b>-2.2</b> (precise sRGB).
-rgbe -linear		Sets the source and output gamma to 0.0.
-srgb		Sets the source gamma to -2.2 (precise sRGB).
-target_srgb		Sets the output gamma to -2.2 (precise sRGB).
-input_colorspace	sRGB sRGB_precise	Sets the source colorspace profile to an accurate no-gap sRGB.

- DOD -+-I	Oata the account
sRGB_std	Sets the source
sRGB_standard	colorspace profile to
	the standard sRGB.
smpte_170	Sets the source
smpte_170m	colorspace profile to an
170m	accurate no-gap SMPTE
	170M-1999.
smpte_170_std	Sets the source
smpte_170m_std	colorspace profile to
170m_std	the standard SMPTE
smpte_170_standard	170M-1999.
smpte_170m_standard

itu_bt.601_standard rec601_pal rec.601_pal bt601_pal bt.601_pal itu_bt601_pal itu_bt.601_pal	Sets the source colorspace profile to an accurate no-gap ITU-R Recommendation BT.601 (625).
rec601_pal_std rec.601_pal_std bt601_pal_std bt.601_pal_std itu_bt601_pal_std itu_bt.601_pal_std rec.601_pal_standard rec.601_pal_standard bt601_pal_standard bt.601_pal_standard itu_bt601_pal_standard itu_bt601_pal_standard	Sets the source colorspace profile to the standard ITU-R Recommendation BT.601 (625).
generic_film film	Sets the source colorspace profile to generic film.

bt470_ntsc	Sets the source
bt470_m_ntsc	colorspace profile to an accurate no-gap Rec. ITU-R BT.470-6 (M/NTSC).
bt470_pal bt470_m_pal	Sets the source colorspace profile to an accurate no-gap Rec. ITU-R BT.470-6 (M/PAL).
bt470_b bt470_b1 bt470_d bt470_d bt470_g bt470_h bt470_k bt470_k1 bt470_l bt470_n_pal bt470_secam	Sets the source colorspace profile to an accurate no-gap Rec. ITU-R BT.470-6 (B, B1, D, D1, G, H, K, N/PAL, K1, L/SECAM).
ntsc_1987 smpte_c	Sets the source colorspace profile to SMPTE C with a pow(2.2) curve.
ntsc_1987_std smpte_c_std	Sets the source colorspace profile to the standard SMPTE C.
romm_rgb rommrgb	Sets the source colorspace profile to Reference Output Medium Metric RGB (ROMM RGB).
rimm_rgb rimmrgb	Sets the source colorspace profile to Reference Input Medium Metric RGB (RIMM RGB).
erimm_rgb erimmrgb	Sets the source colorspace profile to Extended Reference Input Medium Metric RGB (ERIMM RGB).

	plasa	Sets the source
	plasa_ansi	colorspace profile to
	ptasa_arisi	PLASA ANSI E1.54.
	protune	Sets the source
	protune	
	gopro	colorspace profile to
	o gomut	Protune Native (GoPro).
	s-gamut	Sets the source
	sgamut	colorspace profile to S-
	s_gamut	Gamut.
	s-gamut3	Sets the source
	sgamut3	colorspace profile to S-
	s_gamut3	Gamut3.
	s-gamut3cine	Sets the source
	sgamut3cine	colorspace profile to S-
	s_gamut3cine	Gamut3.Cine.
	s-gamut3_cine	
	sgamut3_cine	
	s_gamut3_cine	
-target_colorspace	Same as for	Sets the output
	-input_colorspace.	colorspace profile.
-input_colorspace_file	<file path=""></file>	Sets the input
		colorspace profile.
		Loads .ICC and .ICM
		files.
-target_colorspace_file	<file path=""></file>	Sets the output
		colorspace profile.
		Loads .ICC and .ICM
		files.
-dont_embed_icc		No colorspace profile
		will be embedded into
		files with colorspace-
		profile support.
-embed_icc		Any specified output
		colorspace profiles will
		be embedded into files
		with colorspace-profile
		support. This is the
		default.
-ignore_input_colorspace_gamma		The gamma in any
		supplied or embedded
		input colorspace profile
		will be ignored.

-rendering_intent -render_intent	perceptual	All colors are scaled to fit into the target colorspace. Useful for converting from wide colorspaces to more narrow ones.
	relative_colorimetric	Colors in gamut are unchanged, but colors outside of gamut are clipped to the nearest in-gamut color. This is the default.
	saturation	Like <b>perceptual</b> , but tends to make colors more saturated.
	absolute_colorimetric	Not intended for color conversion, but rather typically for digital inkjet proofing.

# Resampling

Command	Parameter	Description
-filter	box	Applies the selected filter to
	point	all non-mipmap filters.

filters.			
			filters.

-prescale3 -resample_size	<new width=""> <new height=""> <new depth=""></new></new></new>	Resamples the image to the given width/height/depth using the selected non-mipmap filters.
-resample_to	nearest	Resamples to the nearest power of 2 in each dimension.
	lo	Resamples to the next power-of-2 down.
	hi	Resamples to the next power-of-2 up.
-rel_scale	<width multiplier=""> &lt; height multiplier&gt;</width>	Resamples by the given width and height multipliers.
-rel_scale3	<width multiplier=""> &lt; height multiplier&gt; &lt; depth multiplier&gt;</width>	Resamples by the given width, height, and depth multipliers.
-clamp2 -clamp	<width> <height></height></width>	Clamps the image to the given width and height.
-clamp3	<width> <height> <depth></depth></height></width>	Clamps the image to the given width, height, and depth.

# Texture Addressing

Command	Parameter	Description
-textureaddressing -ta	clamp	U, V, and W coordinates are clamped to the edge of the texture.  Equal to  D3D12_TEXTURE_ADDRESS_MODE_CLAMP.
	repeat wrap	U, V, and W coordinates repeat beyond the 01 range. Equal to D3D12_TEXTURE_ADDRESS_MODE_WRAP.
	mirror reflect	U, V, and W are mirrored beyond the 01 range. Equal to D3D12_TEXTURE_ADDRESS_MODE_MIRROR.
	mirroronce mirror_once	U, V, and W are mirrored 1 time beyond the 01 range, after which clamping is used. Equal to  D3D12_TEXTURE_ADDRESS_MODE_MIRROR_ONC E.

	border bordercolor border_colo r	The border color is used when U, V, and W go outside of 01.  Equal to  D3D12_TEXTURE_ADDRESS_MODE_BORDER.
	no_border nul_border	Nothing is considered to exist beyond the U, V, and W texture edges. This is the default.
-textureaddressingw -taw	Same as - ta.	Applies only to the U coordinate.
-textureaddressingh -tah	Same as - ta.	Applies only to the V coordinate.
-textureaddressingd -tad	Same as - ta.	Applies only to the W coordinate.
- textureaddressingw_opaqu e -taw_color	Same as - ta.	Applies only to the U coordinate and to color channels.
- textureaddressingh_opaqu e -tah_color	Same as - ta.	Applies only to the V coordinate and to color channels.
- textureaddressingd_opaqu e -tad_color	Same as - ta.	Applies only to the W coordinate and to color channels.
- textureaddressingw_alpha -taw_alpha	Same as - ta.	Applies only to the U coordinate and to the alpha channel.
-textureaddressingh_alpha -tah_alpha	Same as - ta.	Applies only to the V coordinate and to the alpha channel.
-textureaddressingd_alpha -tad_alpha	Same as - ta.	Applies only to the W coordinate and to the alpha channel.
-border_color	<r> <g> <b><a></a></b></g></r>	Sets the border color for the U, V, and W coordinates. Defaults to <b>0.0 0.0 1.0</b> .

# YUV Options

-yuv_set_s - yuv_set_sc ale	<scale></scale>	Sets the scaler (01) for saving to a YUV file.  Defaults to 1.0.
- yuv_input_ pc		Sets the black level to 0.0, scale to 1.0, Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for loading YUV files.
-yuv_pc		Sets the black level to 0.0, scale to 1.0, Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for saving to a YUV file.
- yuv_input_ studio		Sets the black level to (16.0 / 255.0), scale to (219.0 / 255.0), Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for loading YUV files.
- yuv_studio		Sets the black level to $(16.0 / 255.0)$ , scale to $(219.0 / 255.0)$ , Kr and Kb to the ITU-R Recommendation BT.709-5 standard, and enables the full non-approximate conversion routine for saving to a YUV file.

### Indices & Palettes

Command	Parameter	Description

# Mipmaps

Command	Parameter	Description
<ul><li>-nomips</li><li>-nomipmaps</li><li>-no_mips</li><li>-no_mipmaps</li></ul>		No mipmaps are generated and existing mipmaps are discarded.
-nmips	<total mipmaps=""></total>	Sets the total number of mipmaps desired. Set to 0 to generate (or keep) a full mipmap chain. Defaults to <b>0</b> .
-keepmips		By default, new mipmaps will be generated as specified by <b>-nmips</b> (which defaults to <b>0</b> , so a full chain is generated).

-keepmipmaps -keep_mips -keep_mipmaps		This command allows existing mipmaps to be retained instead of overwritten. Existing mipmaps beyond the <b>-nmips</b> specification will be truncated, and if <b>-nmips</b> extends beyond the number of existing mipmaps then new mipmaps will be generated to fill the gap.
-mip_filter	Same as for <b>-filter</b> .	Applies the selected filter to all mipmap filters.
-mip_filterw	Same as for <b>-filter</b> .	Sets the mipmap color and alpha width filter.
-mip_filterh	Same as for <b>-filter</b> .	Sets the mipmap color and alpha <i>height</i> filter.
-mip_filterd	Same as for <b>-filter</b> .	Sets the mipmap color and alpha <i>depth</i> filter.
-mip_filterw_color	Same as for <b>-filter</b> .	Sets the mipmap color width filter.
-mip_filterh_color	Same as for <b>-filter</b> .	Sets the mipmap color <i>height</i> filter.
-mip_filterd_color	Same as for <b>-filter</b> .	Sets the mipmap color depth filter.
- mip_filterw_alpha	Same as for <b>-filter</b> .	Sets the mipmap alpha width filter.
-mip_filterh_alpha	Same as for <b>-filter</b> .	Sets the mipmap alpha <i>height</i> filter.
-mip_filterd_alpha	Same as for <b>-filter</b> .	Sets the mipmap alpha depth filter.

## Normal Maps

Command	Parameter	Description
-nm_channel	r red	The normal map will be generated using the R channel.
	g green	The normal map will be generated using the G channel.
	b blue	The normal map will be generated using the B channel.
	a alpha	The normal map will be generated using the A channel.
	max	The normal map will be generated using the max value between the RGBA channels. This is the default.
	rgb	The normal map will be generated using the average value between the RGB channels.
	colorspace	The normal map will be generated using the weighted average value between the RGB channels.
		Use <b>-luma</b> to select from predefined weights or <b>-weight</b> to manually specify weights.

-norm -normalize	Indicates that the normal maps should be normalized.
-opengl -unity -blender -maya	Specifies that the normal map should be compatible with OpenGL.
-directx -ue4 -unreal -unrealengine -ue -dsmax	Specifies that the normal map should be compatible with DirectX.
-n3x3	Normal maps will be generated with a 3×3 kernel.
-n5x5	Normal maps will be generated with a 5×5 kernel.
-n7x7	Normal maps will be generated with a 7×7 kernel.
-n9x9	Normal maps will be generated with a 9×9 kernel.
-scale -nm_z	Specifies the normal map's Z influence.

### Transforms

Command	Parameter	Description
-format	<any dxgi,="" metal<="" or="" th="" vulkan,=""><th>Converts the loaded image</th></any>	Converts the loaded image
	format>	to the given texture format.
-ogl_format	<internal format=""> <type></type></internal>	Converts the loaded image
	<base format="" internal=""/>	to the given OpenGL texture
		format.
-ignore_alpha		Any alpha channel is set to
		all 1's.
-alpha_threshold	<cutoff></cutoff>	Sets the alpha cutoff
		([0255]) for conversions to
		formats with binary alpha.
		Defaults to 128.
-premultiply_alpha		Specifies that alpha should
-premult_alpha		be pre-multiplied.
		If an image is already pre-
		multiplied it is not pre-
		multiplied again.
-swizzle	<swizzle></swizzle>	Specifies a swizzle to apply.

	Valid swizzle characters: rgbaxyzw01. Must be 4 characters long and is not case-sensitive.
-swap	Swaps the R and B channels.

# **Quality Settings**

Command	Parameter	Description
-quality_highest		The highest quality setting for compressing textures
-very_slow		in BC*, EAC, ETC*, PVR, and ASTC formats.
-quality_production		The 2 <sup>nd</sup> -highest quality setting for compressing
-slow		textures in BC*, EAC, ETC*, PVR, and ASTC formats.
-quality_normal		The normal quality setting for compressing textures
-basic		in BC*, EAC, ETC*, PVR, and ASTC formats.
-fast		A fast but somewhat low-quality setting for
		compressing textures in BC*, EAC, ETC*, PVR, and
		ASTC formats.
-quick		A faster but lower-quality setting for compressing
-veryfast		textures in BC*, EAC, ETC*, PVR, and ASTC formats.
-ultrafast		The fastest but lowest-quality setting for
		compressing textures in BC*, EAC, ETC*, PVR, and
		ASTC formats.

## Misc.

Command	Parameter	Description
-weight	<red weight=""> <green< th=""><th>Sets the luminance weight factors</th></green<></red>	Sets the luminance weight factors
-weights	weight> <blue weight=""></blue>	manually.
-luma	REC_709 REC709	Sets the luminance weight factors according to the ITU-R Recommendation BT.709-5 standard. 0.212639005871510, 0.715168678767756, and
		0.072192315360734. This is the default.
	REC_2020 REC2020	Sets the luminance weight factors according to the ITU-R Recommendation BT.2020 standard. 0.2627, 0.678, and 0.0593.
	SMPTC	Sets the luminance weight factors according to the SMPTE C standard. 0.2124, 0.7011, and 0.0866.

	REC_601 REC601	Sets the luminance weight factors according to the ITU-R Recommendation BT.601 standard. 0.2988390, 0.5868110, and 0.1143500.
	CIE_1931 CIE1931	Sets the luminance weight factors according to the CIE 1931 standard. 0.3086, 0.6094, and 0.0820.
	NTSC_1953 NTSC1953	Sets the luminance weight factors according to the NTSC 1953 standard. 0.3, 0.59, and 0.11.
	EBU_TECH_3213 EBUTECH3213	Sets the luminance weight factors according to the EBU Tech. 3213 standard. 0.2988390, 0.5868110, and 0.1143500.
-printformats -print_formats		Prints all supported formats that can be supplied to <b>-format</b> .

# **PNG Options**

Command	Parameter	Description
-png_default		Default PNG compression (6) will be used.
-png_bestspeed		Fast PNG compression (1) will be used.
-png_bestcompression		Best PNG compression (9) will be used.
-png_level		Specifies the PNG compression level. [09].
-png_nocompression		No PNG compression will be used.
-png_interlaced		Interlacing will be used. The default is no interlacing.
-png_format	R8G8B8 RGB24 RGB	Specifies the PNG format to which to save.  If the format is not specified, the closest format to what was specified by <b>-format</b> (or the original file's format if <b>-format</b> is not specified) will be used.

## **BMP Options**

Command	Parameter	Description
-bmp_rle		RLE encoding will be used to save the BMP file.
		This is not set by default.
-bmp_noalpha		Alpha will not be saved or will be set to 1 in the BMP file. The default is to store alpha when available.
-bmp_nobitmask -bmp_nomask		By default, the BMP file will contain masks for the R, G, B, and A channels. This setting causes the BMP

-bmp_format	R8G8B8 RGB24 RGB	file to be saved without the masks. See Notes. Specifies the BMP format to which to save. See Notes. If the format is not specified, the closest format to what was specified by -format (or the original file's format if -format is not specified) will be used.

# TGA Options

Command	Parameter	Description
-tga_rle		The TGA file will be saved
		with RLE encoding.
-tga_format	R8G8B8	Specifies the TGA format to
		which to save.

RGB24 RGB	If the format is not specified, the closest format to what was specified by <b>-format</b> (or the original file's format if <b>-format</b> is not specified) will be used.

### **Notes**

#### Gamma

- Positive values use a raw pow(1/ $\gamma$ )-based gamma curve. Negative values are divided into 2 halves: If  $\gamma$  is <= -1.0, an XtoLinear transform is applied; if -1.0 <  $\gamma$  < 0.0, a LinearToX transform is applied, where X is the curve specified by one of the standards (sRGB, ITU-R Recommendation BT.709-5, etc.) Generally, gamma will be above 1.0 or below -1.0.
- The default standard curve is sRGB Precise, so a default value of -2.2 results in a precise sRGB -> Linear transform.
- The relationship is reversed for target gamma. A positive value results in a pow( $\gamma$ ) transform being applied, while if  $\gamma$  is <= -1.0, a LinearToX transform is applied; if -1.0 <  $\gamma$  < 0.0, an XtoLinear transform is applied.
- This means that when considering gamma, you specify what the input is and what the target should be. By knowing what the input gamma is, the reverse transform can be applied to put the image back into linear space, and by knowing what the

target gamma should be, a proper transform from linear to the target gamma can be made.

#### **Texture Addressing**

- Texture addressing is used during resampling and normal-map creation.
- For standard image resampling, nul\_border is appropriate, as it will only sample
  from in-image texels, meaning no influence from outside 0..1 at all, and edge texels
  won't have an abnormally large influence as they would with clamp. For in-game
  textures, select the addressing mode that matches how it will be addressed in the
  game.

#### YUV

- By default, YUV <-> RGB algorithms that take additional parameters (Kr, Kb, Z, and B) are used. These provide reliable conversions, but many implementations use an approximation for these conversions, which can result in slight adjustments to the colors. Switching to the approximate conversion would be appropriate if you are dealing with a YUV file that has been adjusted to account for this color shift.
- The approximate YUV algorithm does not use Kr, Kb, Z, or B.
- YUV files that contain multiple frames are loaded as 3-D volume textures, with each slice of the depth component being a frame. You can resample the depth component to change the number of frames in the animation. This effectively smoothly speeds up or slows down the animation. Because this is a resampling through time rather than over color frequencies, a linear filter is most appropriate unless a specific visual effect is desired.

#### BMP

- Bit masks aren't used when saving a file as RLE.
- Some packed formats, such as A4R4G4B4, will only retain their component orders if bit masks are used. Without bit masks, the saved BMP file may have swizzled the components (for example to R4G4B4A4).
